

EXPERIMENT – 3b

Prototype with Navigation using Wireflow

Roll No. 240701253

Name: Keerthana C

AIM

To design a low-fidelity wireflow prototype of a mobile application incorporating both familiar and unfamiliar navigation elements and analyze user interaction patterns using Wireflow.

PROTOTYPE OVERVIEW

A wireflow prototype of the mobile application **ParkPilot** was created using Wireflow. This prototype visually represents the user journey through interconnected screens, focusing on navigation flow rather than detailed UI design. It highlights how users move between onboarding, authentication, dashboard, map, booking, and profile functionalities.

SCREEN-WISE DESCRIPTION

1. Onboarding Screen — Entry Point

This is the first screen in the wireflow, introducing the application.

Familiar Navigation Elements

- Standard onboarding entry seen in most mobile apps
- Simple visual representation indicating app introduction
- Linear progression to the next screen

Unfamiliar Navigation Elements

- No explicit button shown (depends on flow understanding)
- Users must infer next step from directional arrows

Purpose

This screen establishes the starting point and tests whether users can follow flow-based navigation without explicit UI cues.

2. Authentication Screen — Login / Sign-Up

This screen allows users to either log in or create an account.

Familiar Navigation Elements

- Common login/sign-up structure
- Input fields and selection options
- Clear transition from onboarding

Unfamiliar Navigation Elements

- Multiple outgoing paths shown simultaneously
- Users must decide direction based on flow arrows rather than buttons

Purpose

Represents decision-making in navigation and introduces branching in user flow.

3. Home Dashboard Screen — Central Hub

After authentication, users land on the home screen.

Familiar Navigation Elements

- Dashboard-style layout
- Profile icon and feature access points
- Acts as a navigation hub

Unfamiliar Navigation Elements

- No explicit labels for actions (based on wireflow abstraction)
- Users rely on structure rather than detailed UI cues

Purpose

Serves as the main control center from which users navigate to different features.

4. Map Screen — Navigation Interface

This screen represents the parking map functionality.

Familiar Navigation Elements

- Map-like layout with location markers
- Structured sections resembling real-world navigation apps

Unfamiliar Navigation Elements

- Static representation (no interaction in wireflow)
- Flow arrow defines navigation instead of user action

Purpose

Illustrates spatial navigation and how users reach parking-related features.

5. Book Slots Screen — Action Confirmation

This screen represents successful parking slot booking.

Familiar Navigation Elements

- Confirmation symbol (tick/check mark)
- Simple success message layout
- Clear action completion feedback

Unfamiliar Navigation Elements

- No visible process steps (booking seems instant)
- Users may not see intermediate steps

Purpose

Demonstrates task completion and feedback in the user journey.

6. Profile and Logout Screen

This screen allows users to view account details and log out.

Familiar Navigation Elements

- Profile icon representation
- Logout option included
- Standard account management concept

Unfamiliar Navigation Elements

- Modal-style representation without clear trigger
- Navigation path loops back to login screen via flow line

Purpose

Shows hierarchical navigation and session control.

7. Logout Flow — Return to Authentication

After logout, the user is redirected back to the login screen.

Familiar Navigation Elements

- Standard logout behavior
- Session reset

Unfamiliar Navigation Elements

- Flow arrow explicitly shows system transition
- No intermediate confirmation step shown

Purpose

Represents application state change and lifecycle completion.

FLOW CHARACTERISTICS (Based on Your Wireflow Image)

➤ **Linear + Branching Navigation:**

Onboarding → Login → Multiple paths (Home, Map, Booking)

➤ **Central Hub Model:**

Home screen acts as the main connector

➤ **Loop-back Mechanism:**

Profile → Logout → Login screen

➤ **Arrow-Based Navigation Understanding:**

Users interpret movement through directional connectors instead of buttons

USABILITY EVALUATION CONSIDERATION

➤ **Familiar Elements**

- Login system
- Dashboard structure
- Profile and logout flow
- Confirmation screen

➤ **Unfamiliar Elements**

- Arrow-based navigation (no buttons)
- Lack of explicit interaction cues
- Static representation of interactive screens
- Multi-directional flow from a single node

CONCLUSION

The Wireflow prototype of **ParkPilot** effectively represents the application's navigation structure using a simplified, flow-based approach. By combining familiar application patterns with abstract navigation elements, the prototype highlights how users interpret movement and decision-making in the absence of full UI detail. This approach is useful for early-stage usability analysis and refining user journeys before high-fidelity prototyping.
